IN THE CLAIMS

FEB 0 1 2007

The pending unamended claims are reproduced below.

1. (PREVIOUSLY PRESENTED) A computer-implemented system of developing multitier business applications, comprising:

an Integrated Development Environment (IDE), executed by a computer, for creating and maintaining a multi-tier business application on a multiple tier computer network, wherein the IDE includes a Topological Multi-Tier Business Application Composer that is used by a developer to graphically create and maintain the multi-tier business application, a Meta-model that captures and persistently stores information entered via the Composer, and an Interactive Agent that monitors the Meta-model for an occurrence of an event that comprises a possible non-optimization in a portion of the multi-tier business application based upon an heuristic analysis of information gathered by the Composer and stored within the Meta-model, wherein the Interactive Agent operates from a knowledge base stored as a part of the Meta-model, and the knowledge base is structured in such a way that the occurrence of the event causes the Interactive Agent to access the knowledge base to identify context information comprising a list of suggested and recommended actions for the event, in order to trigger a display of a graphical element including the context information in the Composer to interact with the developer.

2. (ORIGINAL) The system of claim 1, wherein the Interactive Agent includes a Novice mode, and the Interactive Agent is triggered in the Novice Mode when an event occurs that is selected from a group comprising:

opening a new window;
adding a new type of graphical element to a window;
repetitiously adding a same type of graphical element to a window;
transitioning from one window to another window;
defining more than a predetermined number of tiers;
defining less than a predetermined number of workstations;
defining less than a predetermined number of workstations;
defining more than a predetermined number of workstations;
defining more than a predetermined number of applications;
defining less than a predetermined number of applications;

defining more than a predetermined number of data paths; defining less than a predetermined number of data paths; failure to use a specified feature in a window; and an apparent non-awareness of a specified feature in a window.

3. (CANCELED)

- 4. (PREVIOUSLY AMENDED) The system of claim 1, wherein the possible nonoptimization is determined by examining attributes of the multi-tier business application stored within the Mera-model.
- 5. (ORIGINAL) The system of claim 1, wherein the Meta-model is updated and kept in synchronization with any updates made to the multi-tier business application via the Composer window.
- 6. (PREVIOUSLY AMENDED) A computer-implemented method for developing multitier business applications, comprising:

creating and maintaining a multi-tier business application on a multiple tier computer network using an Integrated Development Environment (IDE) executed by a computer, wherein the IDE includes a Topological Multi-Tier Business Application Composer that is used by a developer to graphically create and maintain the multi-tier business application, a Meta-model that captures and persistently stores information entered via the Composer, and an Interactive Agent that monitors the Meta-model for an occurrence of an event that comprises a possible non-optimization in a portion of the multi-tier business application based upon an heuristic analysis of information gathered by the Composer and stored within the Meta-model, wherein the Interactive Agent operates from a knowledge base stored as a part of the Meta-model, and the knowledge base is structured in such a way that the occurrence of the event causes the Interactive Agent to access the knowledge base to identify context information comprising a list of suggested and recommended actions for the event, in order to trigger a display of a graphical element including the context information in the Composer to interact with the developer.

7. (ORIGINAL) The method of claim 6, wherein the Interactive Agent includes a Novice mode, and the Interactive Agent is triggered in the Novice Mode when an event occurs that is selected from a group comprising:

opening a new window;
adding a new type of graphical element to a window;
repetitiously adding a same type of graphical element to a window;
transitioning from one window to another window;
defining more than a predetermined number of tiers;
defining less than a predetermined number of workstations;
defining less than a predetermined number of workstations;
defining more than a predetermined number of workstations;
defining more than a predetermined number of applications;
defining less than a predetermined number of applications;
defining less than a predetermined number of data paths;
defining less than a predetermined number of data paths;
failure to use a specified feature in a window; and
an apparent non-awareness of a specified feature in a window.

8. (CANCELED)

- (PREVIOUSLY AMENDED) The method of claim 6, wherein the possible nonoptimization is determined by examining attributes of the multi-tier business application stored within the Meta-model.
- 10. (ORIGINAL) The method of claim 6, wherein the Meta-model is updated and kept in synchronization with any updates made to the multi-tier business application via the Composer window.
- 11. (PREVIOUSLY AMENDED) An article of manufacture comprising a computerreadable device or medium embodying instructions that, when read and executed by a computer, results in the computer performing a method for developing multi-tier business applications, the method comprising:

creating and maintaining a multi-tier business application on a multiple tier computer network using an Integrated Development Environment (IDE) executed by the computer, wherein the IDE includes a Topological Multi-Tier Business Application Composer that is used by a developer to graphically create and maintain the multi-tier business application, a Meta-model that captures and persistently stores information entered via the Composer, and an Interactive Agent that monitors the Mera-model for an occurrence of an event that comprises a possible non-optimization in a portion of the multi-tier business application based upon an heuristic analysis of information gathered by the Composer and stored within the Mem-model, wherein the Interactive Agent operates from a knowledge base stored as a part of the Meta-model, and the knowledge base is structured in such a way that the occurrence of the event causes the Interactive Agent to access the knowledge base to identify context information comprising a list of suggested and recommended actions for the event, in order to trigger a display of a graphical element including the context information in the Composer to interact with the developer.

12. (ORIGINAL) The article of manufacture of claim 11, wherein the Interactive Agent includes a Novice mode, and the Interactive Agent is triggered in the Novice Mode when an event occurs that is selected from a group comprising:

opening a new window; adding a new type of graphical element to a window; repetitiously adding a same type of graphical element to a window; transitioning from one window to another window; defining more than a predetermined number of tiers; defining less than a predetermined number of tiers; defining more than a predetermined number of workstations; defining less than a predetermined number of workstations; defining more than a predetermined number of applications; defining less than a predetermined number of applications; defining more than a predetermined number of data paths; defining less than a predetermined number of data paths; failure to use a specified feature in a window; and an apparent non-awareness of a specified feature in a window.

13. (CANCELED)

- 14. (PREVIOUSLY AMENDED) The article of manufacture of claim 11, wherein the possible non-optimization is determined by examining attributes of the multi-tier business application stored within the Meta-model.
- 15. (ORIGINAL) The article of manufacture of claim 11, wherein the Meta-model is updated and kept in synchronization with any updates made to the multi-tier business application via the Composer window.
